Fe3O4 single sphere on a surface - centre-axis through-focus response (λ = 532 nm, target NA = 1.45; z_centre = 15 / 50 / 100 nm)
all 171 saved zeta layers; zeta is the defocus coordinate of the through-focus stack, not a sample-space depth
(a) signed I_cross - linear scale
(b) magnitude - log scale (dynamic range)
(c) shape only - per-particle normalisation
30 nm
100 nm
200 nm
D030, own y-scale
I_cross at x = y = 0
|I_cross| (log)
I_cross/max|I_cross|
zeta (nm)
